Instructions for downloading and installing CS301 stub homework website

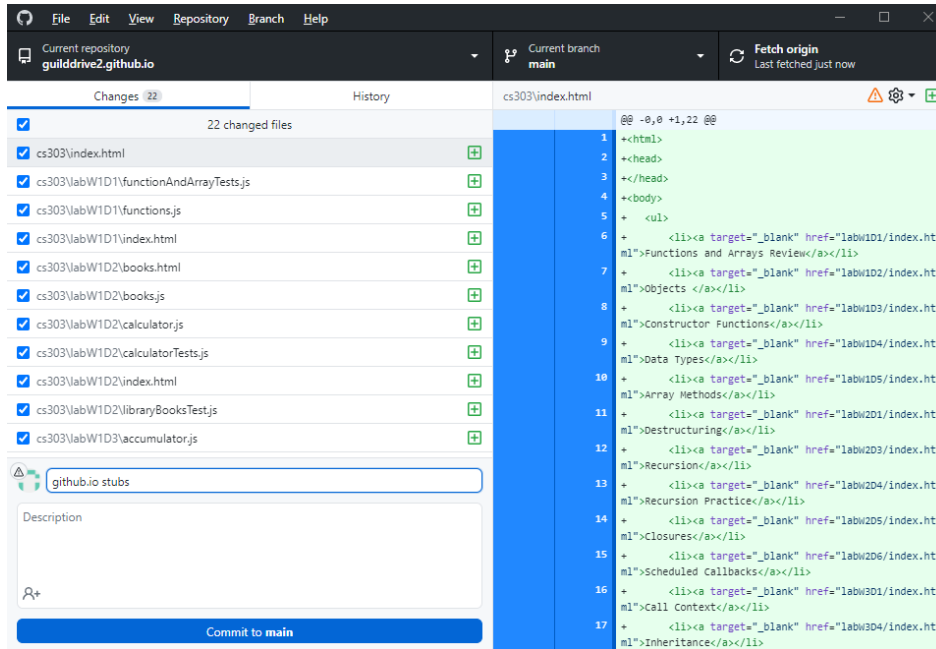

1. Find the following zip file and download it from Sakai: CS303-2021-03E-04C Resources / lab helpers / cs303.zip
2. Create a folder named cs303 in the base of your github.io directory on your harddrive. For example, if your username at github is guilddrive2 and you have created a github pages repository (which we all did in CS301) then your harddrive will look like this after you create the cs303 folder and extract the zip file contents to it.

3. Open the cs303 folder from above in your vscode. It should look like the following. Nothing further to do here for now, but this is where you will do your work for your 303 labs.

4. Open GitHub Desktop with your github.io repository. It should look like the following. Commit the changed files and push them to the cloud.

5. Open your browser to your GitHub Pages website and be sure to include /cs303 at the end. E.g., if your username was guilddrive2 you would go to: <https://guilddrive2.github.io/cs303/> If you see something like the following, then yay!, you are ready to go.
