Instructions for use of GitHub.com repository in CS301

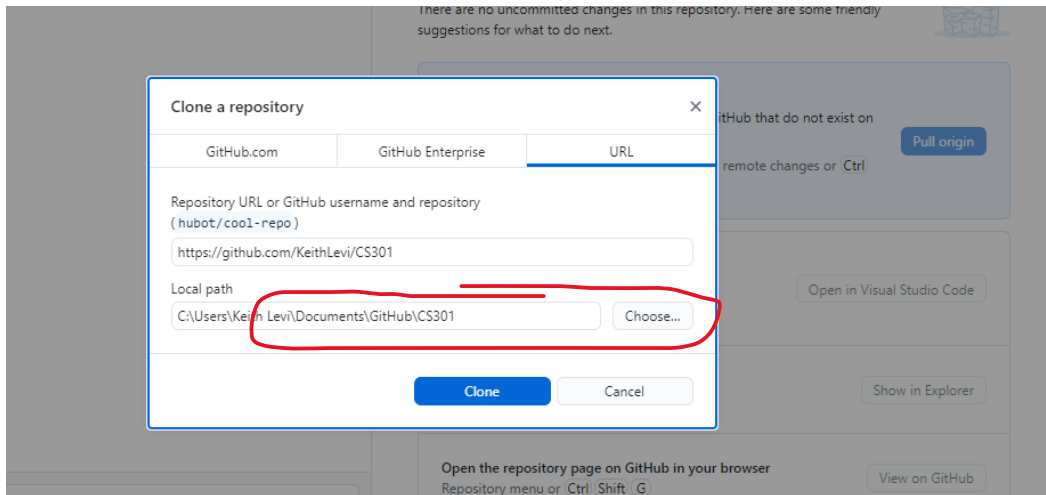

1. Create an account on github.com if you have not already done so
2. In your github.com account create a new repository named CS301

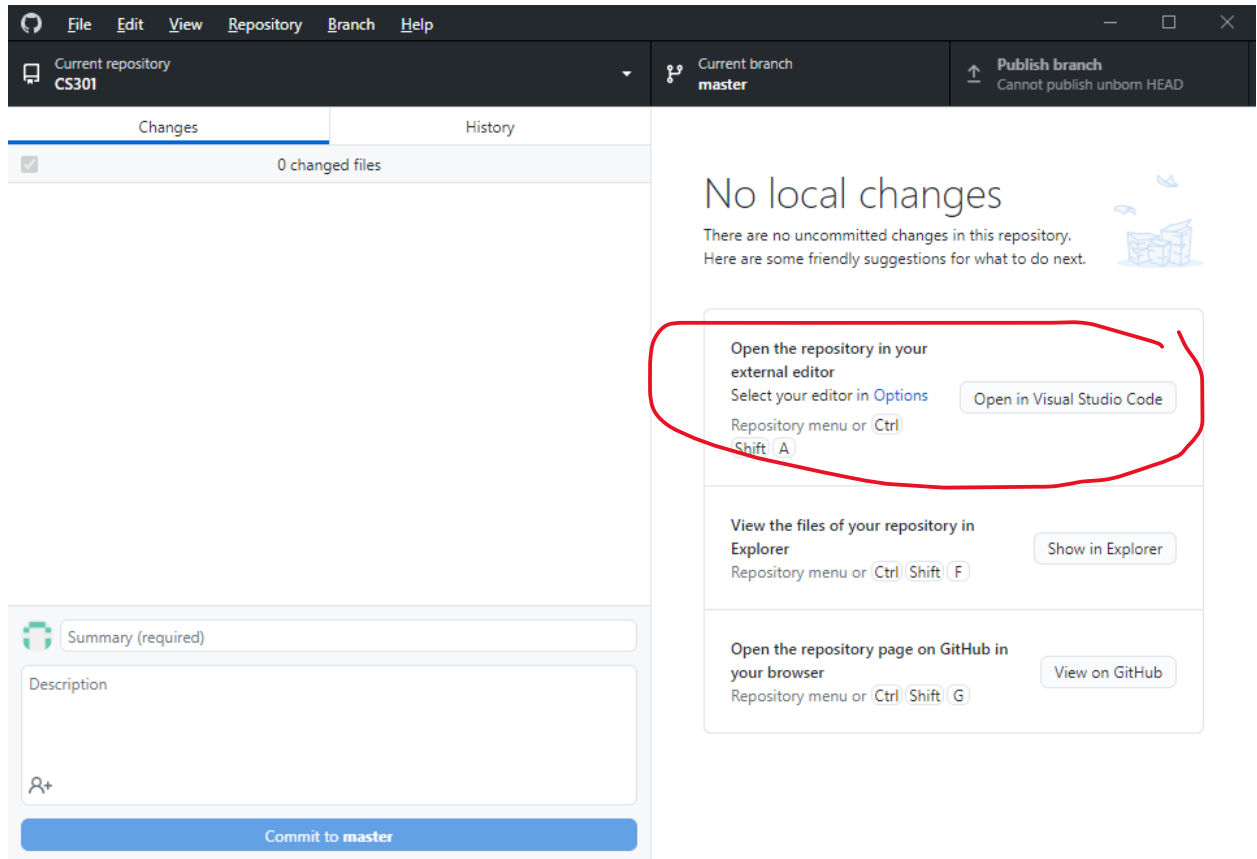

3. Clone that repository to your machine using the Quick setup button Set up in Desktop

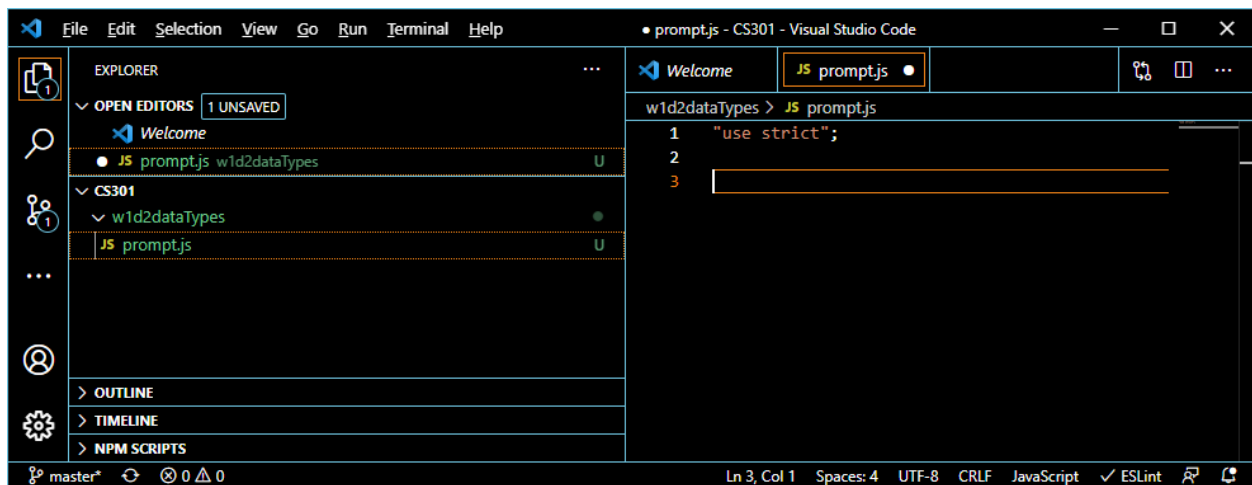

3a. Choose the directory for your repository

4. Open the repository in VS code

5. In VSCode in your CS301 folder you will create a subfolder for each day of the course, e.g., w1d2dataTypes, w1d3selection, etc. Inside those folders you will create .js files for your code.

6. After you write and save the code you should commit it to the local repository and then push it to the remote github.com repository using GitHub Desktop. Note that you only have to create the one repository for the entire course, CS301. After that you only have to create new VSCode folders for each day's assignments and then commit and publish when you are ready to submit.
